EasyABC allows you to edit and play abc files It supports conversion from MusicXML and MIDI to ABC.

OPTIONS -a acheats where acheats specifies the anacrusis in half unit lengths -xa extract the anacrusis from file by finding the first strong note -ga guess the anacrusis by minimizing the number of ties across bars -m time signature time signature -b bars number of bars wanted in output -Q tempo tempo in quarter-notes per minute -u pulses Allows you to specify directly the number of midi pulses per abc time unit. For example if L: 1/8, then a quarter note would be indicated by the value 4, (4 1/16 units). If none of these is present, the program will use the PPQN information in the MIDI header to compute the suitable conversion factor. Alternatively, you can specify its value using the -a option The anacrusis is specified in half unit lengths, where the unit length is defined by the L: field. For most MIDI files on the web, it is recommended to rely on the MIDI header information and not use any of the options other than the formatting options. Use only one or none of the options -u -ga, -b and -Q Midi2abc normally converts the MIDI time units into quantum units normally corresponding to the abc 1/16th note or 1/32nd note. The program will extract the time signature information from the MIDI file if it is present. The latter uses a custom implementation (midi2abc is not used) in order to produce very readable ABC output. Otherwise it will assume 4/4 or you could specify it with -m If the tune has an anacrusis, you can use either the -ga or -xa option to estimate the its length. The output of midi2abc is printed to the screen To save it to a file, use the redirection operator, (e. , -ppu parts per abc unit length Normally, the smallest note unit that midi2abc can extract is half the L: unit length. The user then has to add text fields not present in the MIDI header and possibly tidy up the abc note output.
